Overview

“Why will not those who have large holdings in our commonwealth assist in the up-building of the state? When will relief come to us? Will it be when these hills and valleys have been exhausted of their bounties of nature and when these great mountains have shed their last stately oak, and when the hills will resound with emptiness because the mineral beds that once reposed within have been exhausted in a market beyond the state borders?”

West Virginia Governor Henry D. Hatfield
(1913-1917)

For the better part of the 20th century, land ownership patterns in West Virginia remained virtually unchanged. Large energy and land-holding corporations bought up mineral-rich acres and held them until market conditions were favorable for mining, drilling or leasing. Two separate investigations – one by reporter Tom Miller in 1974 and another by the Appalachian Land Ownership Task Force later that decade – found that vast acres, especially those in the southern coalfields, were controlled by a handful of mostly absentee corporations.

Miller’s comprehensive look at ownership patterns took place nearly one hundred years after the onset of West Virginia’s industrialization. The veteran reporter for *The Huntington (West Virginia) Herald-Dispatch* spent months examining public records in county courthouses and the statehouse in Charleston to determine ownership patterns in all of West Virginia’s 55 counties. The Task Force, while researching records in six states, focused on a sampling of 15 West Virginia counties.

Beginning in early 2012, an informal coalition of West Virginia residents, led by the West Virginia Center on Budget and Policy, began discussions about the possibility of re-examining the issue of land ownership in the state. A series of questions emerged from the discussions: Have ownership patterns changed since the 1970s? If so, how have they changed and what are the ramifications for the state?

But an even more basic question was why a new generation of West Virginians should revisit a subject that was painstakingly researched almost 40 years ago. The answer is the same as that put forth by officials at the Huntington newspapers when they decided to explore the issue. Knowing

who controls land and mineral resources is critical in charting the state’s economic future and informing the nation’s energy policies.

This report draws on 2011 real property data from the West Virginia Tax Department and uses Miller’s study, which relied on 1974 data, for comparison purposes since his was the most thorough previous examination of the state’s land ownership. The top 25 landowners in the state are identified, together with the top ten owners in each individual county. These are compared with the top landowners in Miller’s study. It should be noted that Miller examined mineral ownership and leases, in addition to surface ownership. The 2012 researchers calculated surface ownership only.

Miller also faced challenges in locating and accessing reliable information because West Virginia counties lacked a unified system for collecting and reporting tax data. As a result, both he and the Appalachian Land Ownership Task Force researchers were forced in some cases to make educated guesses, especially as to mineral ownership of specific land parcels.

One of the expectations of those involved in the 2012 project was that land ownership and taxation information would be more uniform and more easily accessible than it was more than 30 years ago. Unfortunately, the availability and quality of the data still hampers research efforts and makes it virtually impossible to create maps that precisely document ownership of every parcel of land in West Virginia. Nevertheless, a great deal of data is available, and it provides a compelling snapshot of West Virginia’s land ownership patterns in the early years of the 21st century.

Key Findings

In 2013 West Virginia is a state in transition. While much of the state’s private land is still owned by large, mainly absentee corporations, the list of top owners – once dominated by energy, land holding and paper companies – now includes major timber management concerns, which are in essence money-managers for investors. The North Carolina-based Heartwood Forestland Fund, a timberland investment company that owns 500,366 acres in 31 counties, is West Virginia’s largest landowner.

As this report was being prepared, the paper giant Mead-Westvaco announced that it has reached an agreement to sell all of its United States timberland to another timber

management company, Plum Creek Timber of Seattle, Washington.¹

In 2011, when ownership information was gathered for this report, Plum Creek was West Virginia’s eighth-largest landowner with 113,832 acres in five counties. MeadWestvaco was the seventh on the ownership list with 115,138 acres in four counties. The property transfer, if finalized, will vault Plum Creek into third place among the state’s landowners with 228,970 acres, behind Heartwood and Norfolk Southern, which owns 239,618 acres.

Although the purchase of West Virginia’s land by timber management companies is perhaps the most interesting finding by investigators for this report, researchers also found:

- The top 25 private owners own 17.6 percent of the state’s approximately 13 million private acres.
- In six counties, the top ten landowners own at least 50 percent of private land. Of the six, five are located in the southern coalfields – Wyoming, McDowell, Logan, Mingo and Boone. Wyoming County has the highest

concentration of ownership of any county.

- Not one of the state’s top ten private landowners is headquartered in West Virginia.
- Many of the counties - including Harrison, Barbour, Mineral, Lincoln, and Putnam - that had high concentrations of absentee corporate ownership (over 50%) in Miller’s 1974 study did not in this analysis.
- Only three corporations that were among the state’s top ten landowners in 1974 remained on that list in 2011. If the sale of MeadWestvaco properties to Plum Creek Timber is completed, only two of the 1974 top owners will still be on the list.
- Nationally timberland management concerns control about half of the nation’s timberlands that had been managed by industrial timber companies until the 1980s.

Section One

A Short History of Land Ownership in West Virginia

“The wealth of this state is immense; the development of this wealth will earn vast private fortunes far beyond the dreams of a modern Croesus; the question is whether this vast wealth shall belong to persons who live here and who are permanently identified with the future of West Virginia, or whether it shall pass into the hands of persons who do not live here and care nothing for our state except to pocket the treasures which lie buried in our hills.”

– West Virginia Tax Commission Report, 1884

Who Owns West Virginia’s Land and Mineral Resources?

For generations, the question has intrigued historians, sociologists, politicians, journalists and residents. Attempts to find answers offer a roadmap for understanding the political, social and economic development of the Mountain State.

Historians have generally concurred that, for centuries, control of West Virginia’s land has been marked by inequality and absentee ownership.

Long before the first settlers crossed over the Appalachian Mountains, eastern land speculators held title to the majority of the land in what is now West Virginia. King Charles II rewarded many of his loyal friends with what would become West Virginia land, and Thomas, Lord Fairfax, was bequeathed much of today’s Eastern Panhandle.² By the 1730s, three land companies – the Ohio Company, Greenbrier Company and Loyal Company – owned some 800,000 acres of West Virginia land.³

Among the first Anglo Americans who ventured into West Virginia were surveyors and land speculators, including George Washington, who eventually came into possession of some 32,000 acres.⁴ When asked if he would be interested in selling the land he owned in Kanawha County, Washington offered a response that echoes throughout the history of West Virginia: “I had never had it in contemplation because I well knew they would rise more in value than the purchase money at the present time would accumulate by interest.”⁵

By 1810, as much as 93 percent of land in present day West Virginia was held by absentee owners, more than any other state in the region and likely any other state in the Union.⁶

Incorrect surveys, unclear titles and inconsistencies in state law led to overlapping claims that cost many residents their land, sometimes decades after the initial purchase.⁷ Furthermore, in what was already a cash-strapped and credit-poor state, political leaders courted out-of-state capital investment to help the state progress. In his 1897 inaugural address, Governor George W. Atkinson declared, “Instead of fewer corporations in West Virginia, we need more of them. Instead of crushing out those we already have, it is our duty to invite others to come among us to aid us in the development of our almost inexhaustible natural resources.”⁸

Not surprisingly, state officials and state laws more often favored outside investors’ claims to land over those of native farmers. Some critics argued that the ratification of the constitution of 1872, known as the “lawyer’s constitution,” resulted in land laws and tax policies that facilitated the transfer of land to large companies with the resources to win lengthy court cases. In one case, a farmer evicted three tenants of the Elk River Coal and Lumber Company from what he said was his land. Elk River took him to court four times until a circuit court judge eventually ruled in the company’s favor.⁹

During West Virginia’s transformation from an agrarian economy to an industrial state beginning in the 1880s, agents for out-of-state land, railroad and coal interests purchased acres of mineral and timber rights, leaving residents in possession of only the surface rights to the land.

In the early twentieth century, the federal government became one of the largest landholders in West Virginia when the United States Forest Service began buying land to create national forests, partly in response to widespread clear cutting and the fear that the country’s great forests soon would be gone. In 1915, the agency purchased some 7,200 acres near Parsons, West Virginia. This land eventually became the Monongahela National Forest, which today encompasses

es nearly one million acres in ten counties.¹⁰

In the 1960s, partly in reaction to a national focus on poverty in the region, a sense of Appalachian identity began to emerge. With it came a growing concern that outside ownership of land was a major source of regional inequality in America and a significant factor in Appalachia's economic problems. Scholars and activists began to articulate a theory linking underdevelopment with extractive industries, tax policies and a flow of wealth out of the region. Much of this, they said, was a result of the power held by absentee owners.¹¹ The entire Appalachian region was a colony, some maintained, an internal colony, operated and regulated to serve the energy needs of the rest of the nation.

In the 1970s, two separate studies examined land ownership patterns in West Virginia.

Tom D. Miller, an investigative reporter for the Huntington, West Virginia, *Herald-Dispatch*, was the first to approach the issue in a systematic manner. Over a six-month period in 1974, Miller visited more than a dozen courthouses across the state and plowed through thousands of pages of public records. His effort stands as the most complete attempt to document land ownership in the state.

Miller concluded that more than two-thirds of West Virginia's non-public land was controlled by outside interests, predominantly giant coal, timber, oil and gas companies. Specifically, he found that:

- Two dozen out-of-state corporations and land companies – all tied directly or indirectly to mineral industries – owned a third of the state's 12 million privately held acres.
- Thirteen large companies controlled leases on another four million acres of coal or oil and gas rights in 1971 and the figure grew by an estimated half million acres per year in the following three years.
- Out-of-state corporate interests owned at least half the land in almost 50 percent of West Virginia counties.
- None of the ten largest landholders was headquartered in the state.¹²

In the fall of 1978, a coalition of citizen activists and academics formed the Appalachian Land Ownership Task Force with the intention of determining the extent of corporate and absentee ownership across the Appalachian

region – and the effect of ownership patterns on residents. Their work was funded with a grant from the Appalachian Regional Commission.

In what has been described as one of the most extensive citizen participation research projects ever undertaken, Task Force members reviewed courthouse records and gathered anecdotal information in 80 counties across six Appalachian states from Alabama to West Virginia. The findings were summarized in a seven-volume, 1,800-page report released in 1981, "Land Ownership Patterns and Their Impacts on Appalachian Communities."

The Task Force found that 40 percent of the land surveyed – or some eight million acres – was owned by just 50 private owners and ten government agencies. Individuals and groups from outside the counties sampled owned nearly 75 percent of the surface acres and 80 percent of the mineral acres.

The Task Force conducted research in just 15 of West Virginia's 55 counties (Braxton, Jefferson, Kanawha, Lincoln, Logan, McDowell, Marion, Marshall, Mineral, Mingo, Ohio, Raleigh, Randolph, Summers and Wayne).

However, the findings mirrored Miller's, revealing that:

- Three-fourths of the surface land and four-fifths of the minerals were owned by individuals and groups from outside the counties surveyed.
- Large corporations owned 40 percent of the land and 70 percent of the minerals.
- More than 75 percent of the mineral owners paid less than 25 cents per acre in annual taxes and an average of 90 cents for surface holdings.¹³

The information gathered by Tom Miller and the Appalachian Land Ownership Task Force has weathered the test of time. No one has presented contradictory data challenging the findings. Even an Appalachian Regional Commission review panel that criticized some of the methodology used by the Task Force, concluded that while the study failed to prove that concentrated land ownership was "the root of all Appalachian evil," the report demonstrated that ownership patterns were "probably a contributing cause of much of it."¹⁴

Section Two

Who Owns West Virginia in the 21st Century?

“It is a state whose rich resources have been largely owned and exploited by outside interests. Absentee owners, while living outside the state, wrested from the West Virginia earth the wealth that made them rich -- rich from the toil and sweat and blood and tears of the people in the hill country who worked out their lives, all too often, for a pittance.”

-United States Senator Robert C. Byrd
Child of the Appalachian Coalfields

During the past 30 years, dramatic changes have taken place in West Virginia’s land ownership patterns, which, as Tom Miller wrote in 1974, had “been controlled for decades by large out-of-state companies.” Large out-of-state corporations still hold title to a great deal of the state’s privately owned land, but, for the most part, they are not the same corporations Miller identified. Giant timber management companies, which didn’t even exist until the 1980s, have gobbled up acres of valuable timberlands in the state, replacing familiar coal, gas and land-holding companies on the list of top ten owners of West Virginia’s private land.

Miller’s finding that absentee landlords owned or controlled at least two-thirds of West Virginia’s privately held land came as a stunning revelation for many state residents. Equally shocking was the degree to which the ownership was concentrated in the hands of a small group of companies. “Two dozen corporations – all tied directly or indirectly to mineral industries – own a third of the state’s 12 million privately held acres,” Miller reported.

Today, however, the 25 top private owners hold title to just 17.6 percent of the state’s approximately 13 million privately held acres, still a significant percentage but a dramatic decline in concentration of ownership (**Figure 2.1**).

And only three of the corporations identified by Miller – Consolidation Coal, the Norfolk and Western Railroad and Westvaco (all having been renamed) – are still among the state’s top ten landowners, the 2012 researchers discovered. New names on the list include corporations that do not have deep roots in West Virginia and are not energy-based. As an example, Miller reported that the largest landowner in the state in 1974 was Consolidation Coal Company of Pittsburgh (now Consol Energy) with 554,097 acres in

ten counties. Consol, well known to generations of West Virginia as a leading coal producer, is now the tenth largest owner with 77,612 acres in the ten counties.

The 2011 data revealed that West Virginia’s largest landholder is the Heartwood Forestland Fund, which owns 500,366 acres in 31 counties. Thirty years ago corporations like Heartwood, set up to manage timberlands, did not exist. Today, they are central players in the timber industry, created as a response to global economic conditions and the enactment of legislation addressing retirement funds and tax reform. As these economic forces collided in the 1980s, significant changes took place in timberland ownership, which, in turn, have affected West Virginia’s land ownership.

Until that time, most timber companies were vertically integrated, owning land, timbering operations and pulp and paper mills. In theory, vertical integration protected the paper industry against short-term fluctuations in the price of timber and allowed the companies to monopolize the supply chain within a region. A report by University of Tennessee sociologists Andrew Gunnoe and Paul Gellert found that “by the late 1970s, approximately 80 percent of private industrial timberlands were owned by private companies.”¹⁵

Two large paper companies were among West Virginia’s top ten owners in 1974 – Georgia Pacific was the fourth largest land owner with 377,308 acres in 10 counties and Westvaco, at number six, owned 272,262 acres in 15 counties.

The breakup of the vertically integrated structure came as the result of what Gunnoe and Gellert termed the “financialization” of timberland ownership, which they said was driven by several factors:

- a desire by Wall Street to minimize risk for investors by diversifying investor holdings;
- a widespread belief that timberland assets were undervalued and susceptible to hostile takeovers;
- an increasing mechanization of the timber industry, leading some timber companies to support the idea of liquidating capital and using it for investment.¹⁶

Two pieces of legislation further encouraged the process.

The Employment Retirement Income Security Act of 1974 urged institutional investors to diversify from fixed-income securities, allowing them to make new investments, such as in timberlands. The Tax Reform Act of 1986 provided an incentive by nearly doubling the effective tax rate for corporate timberlands.¹⁷

Timber management companies arose from this convergence of economics and natural resources, which resulted in the creation of two basic organizational structures. One is the Timberland Investment Management Organization (TIMO), of which Heartwood is an example. The other is the Real Estate Investment Trust (REIT), used by West Virginia's eighth largest landowner, Plum Creek Timber.

Heartwood is a subsidiary of The Forestland Group, an independent TIMO formed in 1995 and headquartered in Chapel Hill, North Carolina. TIMOs manage industrial timberland investments for institutional investor clients, such as pension funds, endowments, foundations and universities. Most of Heartwood's landholdings in West Virginia were purchased from MeadWestvaco and other timber and land companies. With the exception of a few large parcels, Heartwood does not own the mineral interests of its West Virginia holdings.¹⁸

Organized as a REIT, Plum Creek Timber is a publicly traded partnership established in 1989 with headquarters in Seattle, Washington. The company owns 113,832 acres of income-producing real estate in five West Virginia counties. REITs have special tax designations allowing companies to classify some revenues from timberland investment as capital gains rather than corporate income, greatly reducing tax liability. They are required to distribute 90 percent of their income back to investors.¹⁹

From their beginnings thirty years ago, TIMOs and REITs have grown increasingly powerful. In 2010, TIMOs managed 22.4 million acres of forestland with an estimated value of \$18 billion for institutional investors in the United States. REITs owned more than 13 million acres valued at more than \$11 billion. Together, the REITs and TIMOs control about half of the nation's timberland that had been managed by industrial timber companies up to the 1980s.²⁰

While the timber management companies own a large share of West Virginia land, energy companies and land-holding companies still hold title to a significant number of acres.

After Heartwood, the following companies round out West Virginia's top ten landowners:

- Norfolk Southern, formerly the N&W Railroad, owns 239,618 acres in eight southern West Virginia counties. Based in Norfolk, Virginia, the company had its origins as the Norfolk and Petersburg Railroad in 1838. Norfolk Southern's natural resources subsidiary, Pocahontas Land Corporation, owns or manages some 1.2 million acres of coal, natural gas and timber resources in six states.
- Natural Resource Partners of Houston, Texas, owns 212,927 acres in nine counties. The company, formed in 2002, is primarily engaged in managing mineral reserve properties and does not actively mine the properties, instead collecting royalties from mine owners.
- Pardee Resources, headquartered in Philadelphia, Pennsylvania, owns and manages 170,312 acres of land and natural resources in nine counties.
- Coastal Lumber of Charlottesville, Virginia, with 147,317 acres in 17 counties, is the largest hardwood lumber company in the eastern United States.
- Penn Virginia, an independent oil and gas company headquartered in Radnor, Pennsylvania, owns 134,036 acres in six counties.
- MeadWestvaco, with 115,138 acres in four counties, is a global packaging company formed in 2002 from the merger of Mead and Westvaco. The company is headquartered in Richmond, Virginia.
- Plum Creek Timberland, the Real Estate Investment Trust headquartered in Seattle, Washington, owns 113,832 acres in five counties.
- Alpha Natural Resources, headquartered in Bristol, Virginia, owns 97,663 acres in eight counties. The world's fifth-largest coal producer, Alpha was formed in 2002.
- Consol Energy, of Pittsburgh, Pennsylvania, owns 77,612 acres in ten counties and produces coal and natural gas fuels that generate two-thirds of the nation's power supply.

Almost forty years have passed since Tom Miller brought land ownership into the state's collective consciousness. During the ensuing decades, no person or group has produced data refuting his findings or reexamining land ownership patterns in all of the state's 55 counties. This report is a first step in revisiting the still provocative question that Miller posed: "Who Owns West Virginia?" And the conclusion he reached: "Not West Virginians."

Section Three

Concentration of Land Ownership by County

"The men who today are purchasing the immense areas of the most valuable lands in the state are not citizens and have only purchased in order that they may carry to their distant homes in the North, the usufruct of the lands of West Virginia, thus depleting the state of its wealth to build grandeur and splendor in other states. . . . In a few years at the present rate of progress, we will occupy the same position of vassalage to the North and East that Ireland does to England."

-West Virginia Governor William A. MacCorkle (1893-97)

This section examines the concentration of land ownership in the state's 55 counties by looking at the top ten largest private landowners as a share of total private land in the county. The results of this analysis will be displayed by looking at counties where the top ten largest private landowners own above 50 percent to less than 10 percent of the private land in the respective county. The MAP below shows that there is substantial variation in large land ownership among the 55 counties in West Virginia. For example, the highest portion of land owned by the top ten owners in Wyoming County is about 76 percent, while in Cabell County the share of land owned by the top ten owners is less than four percent. The 55 county average was 21.1 percent.

There are also large geographical disparities in the share of large private landowners in the state. All but one of the counties where the top ten landowners owned at least 50 percent of the private land is in the southern coalfield coalfields - Wyoming, McDowell, Logan, Mingo and Boone. In the Marcellus gas field counties of the northeast and north-central part of the state, the private land ownership is less concentrated and tends to be owned more by individuals than large out-of-state corporations.

In some of the counties, just one company can own a significant portion of the privately held land. For example, Heartwood Forestland Company owns around one-quarter of the private land in Wyoming, Wetzel, and Clay County, while Norfolk Southern owns one-fifth of McDowell County and Pardee Resources owns nearly one-fifth of Webster County.

The results of this analysis differ sharply from the 1974 study. For example, the results of the FY 2011 analysis find that many of the counties that had high concentrations

of corporate land ownership in 1974 – such as Barbour, Harrison, Lincoln, Mineral and Putnam – rank well below the average concentration of land ownership today. It is very difficult to discern why private land concentration has shrunk in these counties over the last 40 years. It could be an issue of doubling counting acreage – for example, counting both mineral ownership and surface ownership – which took place the 1974 study.

TABLE 3.1

Percentage of Land Owned by Top Ten Landowners

Who Owns West Virginia?

In six counties the top 10 landowners own 50% or more of the county's private land

Source: WVCBP analysis of county land maps

Top Ten Owners Own at Least 50% of Private Land in County

In six West Virginia counties – Boone, Wyoming, McDowell, Logan, Webster, and Mingo – the top ten landowners own at least 50 percent of the private land. Of the 1.7 million acres of private land in these six counties, five companies – Heartwood Forestland Fund, Norfolk Southern, Natural Resource Partners, Pardee Resources, and Alpha Natural Resources – own approximately one-third of the privately held land. In Wyoming County, just two companies - Heartwood Forestland Company and Norfolk Southern - own over 50 percent of the county's privately held land. Four companies in McDowell County own about 50 percent of the private land, while just six companies own about half of Logan County's privately held land.

Section Four

Implications and Recommendations

“For the past 50 years, we have seen our natural resources exploited, in many cases extravagantly and wastefully, by outside capital... West Virginia has been endowed with great wealth in natural resources, and, in my opinion, some of that wealth should be invested in our two major problems of state government, namely roads and schools ... I speak, of course, of turning to the natural resources of West Virginia for a severance tax ... Everyone seems of the opinion that this tax should have been enacted 50 years ago, or 20 years ago, or during the war; but every time that anyone has dared to whisper that such a tax is fair and equitable and should be enacted, he has been met with the cry, ‘It will ruin the coal industry.’ The very needs caused by an expanding coal industry are met with a cry of ‘economic suicide’ when the industry is asked to contribute something toward the support of those needs... We are paying a fearful price to allow the coal to be extracted from the hills of West Virginia. It is only right that we should be able to point with pride to improved roads and schools as a result of this awful toll that we are taking of the beautiful state of West Virginia.”

-West Virginia Governor William C. Marland (1953-57)

From the friends of British monarchs to the land and mineral speculators of the late 19th and early 20th centuries to today’s timberland managers, the story of land and mineral ownership in West Virginia has been marked by exported wealth and internal poverty.

In the past, investors acquired land in West Virginia in order to develop timber, coal, oil and gas resources. Today the ownership is no longer dominated solely by corporations involved in mineral extraction. It also belongs to money managers specializing in pension funds, endowments, foundations and universities – groups that build wealth for people and institutions around the globe.

This shift in ownership raises anew the possibility of revisiting issues and policies that would allow people who call West Virginia home an opportunity to share in the wealth offered by the state’s resources:

1. The state’s leaders should be committed to establishing fair corporate tax rates that produce sufficient revenue for the education and structural infrastructure required

to encourage entrepreneurship, tourism and small business development. Just as earlier studies concluded, the patterns of land ownership in West Virginia have facilitated the flow of wealth, especially from natural resources, out of the state, and because current tax policies are opaque, it is difficult to gauge whether absentee landowners are paying their share of the tax burden. It should be possible for researchers to determine to what extent state tax policies maintain an infrastructure that facilitates the flow of that wealth to distant corporate headquarters.

2. There should be greater transparency in our public records, making it easier for citizens to investigate land and mineral ownership as well as tax rates on such holdings. For example, no meaningful comparison can be made of natural resource assessments because no data is available on the quality of mineral resources (i.e. coal, oil, and gas are only quantified in terms of acreage which provides no information as to the quality of the reserve or how much it has been depleted).
3. West Virginia’s development dollars should be spent wisely and creatively to promote job growth and build a diverse economy for the future.
4. The establishment of a Future Fund (or permanent mineral trust fund) should not be delayed. A trust fund would help build and maintain a stable economy for the future. If such a fund had been created when the coalfields were developed, West Virginia would be among the nation’s wealthiest states, not among its most impoverished.
5. As West Virginia considers its future, comprehending the role that various patterns of land ownership have played in facilitating some kinds of development and impeding others will be critical in formulating policies that will lead the Mountain State in the direction its citizens want to go.

Opportunities for Future Research

This study has only scratched the surface of analyzing and understanding land ownership patterns in West Virginia. The 2011 records data used in this study, or a set for a more recent fiscal year, has the potential to yield many more insights.

For instance, this analysis did not examine mineral ownership or taxation patterns. Future studies could provide an analysis of managed timberlands and the tax rates on those lands. Some of the largest landowners in the state have lands certified as “managed timberlands” and thus are eligible for the managed timberlands tax credit on that land. What this means is that appraised property values can be as low as \$50 per acre. The managed timberland tax incentive was designed to encourage sustainable forest management practices. In reality, this tax incentive allows some of the largest landowners in the state, some of whom are not primarily in the timber business, to pay less in surface taxes than they otherwise would. Because of confidentiality rules, lands designated as managed timberlands are as difficult to access through tax information as coal reserves. Quantifying how this tax credit is used by large landowners is an important area for future research. Acquiring a dataset revealing which parcels are designated as managed timberlands would be the first step in this analysis.

Initially the authors of *Who Owns West Virginia?* had as a goal the acquisition of GIS data with the intention of mapping patterns of ownership. However, researchers encountered several obstacles, including widespread discrepancies between ownership of surface acres and mineral acres as well as discrepancies between deeded acreage and county tax maps. Some potential solutions to these problems may be found by acquiring datasets sold by private companies, whose information appears to be more reliable than some of that available in the 2011 state tax data.

Additional analyses of mineral ownership could be made if the 2011 tax data were more refined or if more accurate data could be obtained. While certain information remains hidden, especially as to the quality and quantity of mineral resources, analysts could still study patterns of mineral ownership by county.

While this report has identified changes in overall patterns of land ownership, there are undoubtedly many other comparisons that can be made by examining the 1974 Miller study, the 1981 Appalachian Land Ownership Task Force study and the present data. Furthermore, a more detailed analysis of land ownership by county might reveal the role that absentee and local land ownership, as well as highly concentrated and widely distributed land ownership, has played in the county’s economic development over time.

In short, studying patterns of land ownership in West Virginia through the lens of the 2011 tax data can help us understand our history, make wise policies in the present and better map the future of the state.

Section Five

Appendix A

Data Availability and Description

For this analysis of land ownership in West Virginia, the State Property Tax Department made the entirety of 2011 property tax records available. Private property is real property, land and anything attached to it, or personal property such as objects, rights or titles that can be owned.

Since 1932, all taxable non-utility property has been divided into four classes:

1. Class I - Personal property related to agriculture. Since 2003, Class I property is completely exempt from taxation.
2. Class II - Real property used and occupied as residential, and all farms.
3. Class III - All non-residential, non-agricultural property including vacant land, rental properties, and commercial real estate outside of incorporated areas.
4. Class IV - All non-residential, non-agricultural property including vacant land, rental properties, and commercial real estate inside of incorporated areas.

For this study, a data set was made available that contained tax tickets for all West Virginia Class II, III and IV property in a large text file. Since 2003, Class I property has not been taxed, and is therefore not assessed and so was not included in this data set. Duplicate tax tickets and “royalty only” tax tickets, those that assess the revenue from a parcel of land accounted for elsewhere, were removed from the data set. We removed “royalty only” tickets because they describe a revenue stream, and not actual real property itself.

Relevant attributes provided for each record were:

- parcel ID: a string of 16-18 digits that identify the county, tax district, tax map, and tax parcel or sub-parcel in which the property can be found.
- owner(s) name
- tax property class
- owner address including a street address, city and state
- the dollar amount of the land’s assessed value for parcels that include surface acres
- the dollar amount of the parcel’s assessed natural resources if any are present, including managed timberland and mineral resources
- legal description of the property

Property Description:

The text file containing data from the state property tax department has field delimiters and can be displayed as a table and analyzed in spreadsheet or database software. However, information about the surface and mineral acreages on each property is contained in the legal description field, along with other text that describes the property.

Area Measurement

Property descriptions contain a description of the area of the property, but this is not always given in acres. Within West Virginia’s tax records, area measurements of parcel sizes come in two general formats: either a measured amount of area, or description of a lot or tract with no information describing the area measurement. Legal descriptions that state an area measurement use acres, measurements of the parcel’s boundaries in feet, or square footage. Measurements of parcel boundaries in feet describe polygons of various forms, but lack an actual area measurement.

The measurements provided for each tax parcel are, in some cases, over a century old, and, in some cases, are based on a rough measurement recorded with the additional text “more or less.” Furthermore, all survey and land measurement over large areas can vary slightly with the map projections and geographic datum used. For these reasons, the acreages contained in each tax parcel description should not be thought of as a precise geometric space. Instead, every acreage contained in the parcel property descriptions is the space as it has been assessed at some time over the last two centuries. This may vary from the parcel’s “true” geometric area. The data presented in this study are an aggregation of the information provided in each parcel measurement.

Ownership Interests

An individual parcel of land or minerals has a unique parcel ID and a unique legal description. However, that unique parcel ID and unique legal description combination may have multiple incidences each with a different owner name and a different value for land and natural resource assessments. This is because ownership interests represent intangible real property and do not physically divide a parcel. Instead, this interest represents a right to the money made from the sale of the land, the minerals, or the timber. Land

and natural resource assessment amounts are proportional to the interests described in the legal description. So, if a parcel ID and legal description combination occurs twice, and one owner has a 2/5 interest and the second owner has a 3/5 interest, the respective land and/or mineral assessments will reflect this 2:3 ratio. In many cases, interests are described as fractions or percentages.

Examples of legal descriptions contained in the property tax records:

1. LOT 138X97' SF, POND FK. & 20 FT R/W -HSE TRL-
2. 30 SF, POND FK.
3. 16 FEE, 2/3 INT., SULPHUR SPRINGS BR.
4. 144.21 FEE, POND FK., 4/6 INT.
5. STRIP 235' WIDE FACING ON JARRELLS BR. PT. OF THIS
6. LOT 50X150 GRIFFITHS BR., BEING .17 AC. SF.
7. 71X147X71X135', POND FK.
8. LOT 109X37.5X28X72, PARKING AREA BEHIND LOTS 4 & 5 SAND BOTTOM VIL (HSE TRL)
9. 6681.60 FEE, 43.55 MIN., 2/3 INT., 7 WELLS POND FK.
10. 7,445.27 MIN., O&G ONLY, POND FK. & PENN VIRGINIA ROYALTY
11. 2 MIN., WEST FK.
12. 101.24 MIN., POND FK.

Re-Coding the Data

In order to measure the surface acreage of each parcel of property the strings of text in each property description had to be converted into numerical values that could be summed. This study used Practical Extraction and Reporting Language, referred to as Perl, in order to create a new dataset that records the acreage of each parcel as recorded in the legal description. The property legal descriptions occur in the data publicly available from the state property tax department as a string of text with the attributes described above. Using logical statements called regular expressions, a Perl program was written that seeks out certain text sequences. Cases such as “86.5 SF” “6.2 AC SURFACE,” “10 ACRES FEE” or “6,889 ACRES” are examples. The program then follows a decision-tree to review the relevant text identified in the property description and assign the identified value into a new column of data. This created a new dataset with columns describing each parcel’s area. The Perl script operates with the following assumptions and parameters:

1. We cannot calculate the area of a parcel that simply describes the property as a lot without detailed survey information. We also cannot calculate the area of polygons simply based on the length of their sides in feet. Parcels with property descriptions that report area

measurements in boundary feet or square feet, or those that simply describe the lot number are not considered by the Perl program and are not part of this study.

2. In cases where an acreage measurement is present alongside a lot number or other description, our regular expression is able to still assign the correct acreage to the parcel.
3. This means that the script excludes a number of parcels that are small enough to be measured in square feet, or to be referred to by their lot number. However, the script does not exclude parcels based on their size alone, but how that size is recorded. A case like “LOT 6 .021 AC SF” parcel would have a .021 surface acreage recorded.
4. For cases where the parcel ID contains the sequence “9999” any acreage that the program identified was assigned as mineral acres, following instructions from staff at the State Property Tax Department.
5. A parcel can have different owners each with a fractional interest in the property. For all cases of owners with varying interests in the property, the surface, fee or mineral acreage was multiplied by the stated interest. This mirrors how assessment amounts are distributed between different owners.
6. In the case “6681.60 FEE, 43.55 MIN., 2/3 INT., 7 WELLS POND FK” the area would be recorded as 4,454.40 acres for one owner, and 2,227.20 acres for the other.
7. Parcels that had different interests in the property without a fraction or percentage to qualify the interest that the owners have were not part of the study.

After running the study’s Perl program on the original dataset, we hand-checked certain selections of records based on the following criteria, and manually updated any anomalous cases:

1. The two-hundred largest parcels in each study county.
2. Parcels with property descriptions that contained the text “AC” multiple times.
3. Parcels with property descriptions that contained surface or fee acreages, but that did not have land assessment values greater than zero.
4. Parcels with property descriptions that contain the words “lot” or “parcel” or “tract” in the legal property description, and the surface acreage returned by the program was greater than 50 acres.
5. Parcels for which the Perl program returned an interest greater than 1.

6. Parcels with property descriptions that contain the text “int” or “interest” multiple times.

At this stage in the development of research data for the study area, a dataset of parcel measurements had been created for each county. These measurements are compared at various places in the results spreadsheets to the official measurements of counties or the state as provided by the U.S. Census Bureau. The U.S. Census Bureau measurement is based on a geometric measurement of the county. The total acreage for each county derived from the property tax data is based on an aggregation of measurements of smaller parcels, each with a chance for error and distortion based on centuries of land survey. For this reason, each county’s Study Area may not be the same as its the physical area as reported by the U.S. Census Bureau. Some counties have more small lots with measurements recorded in a manner that the Perl program discards. Both these reasons can explain why some counties’ study areas are significantly smaller than their Census area.

Owner Research

After the creation of a final parcel dataset, a Perl script was written that added these parcel measurements by owner name. Using information publicly available on the West Virginia Secretary of State’s Business License Database and the Security and Exchanges Commission’s EDGAR website corporate ownership trees were created for all businesses that own over 20 acres. This information was then fed into the script, removing the smaller business names, and aggregate business landholdings under their parent company names. Information in the owner name field could describe a business that:

- currently exists and operates independently
- currently exists and is a subsidiary of another corporation
- no longer operates
- has changed names
- was merged into another business or corporation
- a corporation that also owns other businesses under other names
- a business for which no information is available

SEC’s EDGAR Website

Publicly traded companies like Consol or Natural Resource Partners, as examples, are required to list their subsidiaries in their filings with the Security and Exchanges Commission. These lists of subsidiary companies were incorporated

into the final corporate ownership trees for the state. In the case of Patriot Coal and Arch Coal companies, there was some overlap in the businesses they list in their respective SEC filings. In this case, the list of holdings that Patriot Coal provides on the website they use to publicize information about their bankruptcy proceedings was used.

SOS Business License Database

Basic information for most businesses operating in the state is maintained on this website. In the case of mergers and name changes this information is also recorded for businesses operating in the state. In this way information was gleaned about the current ownership of outdated owner name data contained in the tax records. Business owner names classified as “missing information” are completely lacking any records in the SOS Business License Database.

Other Sources

Other sources such as news articles and the histories published on corporate websites were also incorporated into the final trees of corporate ownership information for the state.

Individual Owners

Individual owner names were not researched for their relationship to businesses operating in the state due to the volume and lack of informational resources. The name I.L. “Ike” Morris was included along with the names of businesses owned by Mr. Morris in order to account for his pronounced tendency to own large tracts of land in his unique name.

This methodology takes what information is publicly available through Internet resources about business ownership, and then uses the script to conform the tax data to these facts. Businesses that are not publicly traded corporations do not have the same requirements to publish information about their corporate holdings. Because of this reason, it is still possible that there are business names in the final results that are in fact still owned by another company or may have been merged into another company. It is also possible that businesses that lack information in the SOS Business License Database may be owned by another company, or may have been merged into another company. For these reasons, the final results of the owners script should be considered as the minimum for measuring a corporation’s total holdings, and not the maximum.

Section Six

Appendix B

4 Suns Ranch – Hancock County

Weirton, WV

Alawest Incorporated – McDowell County

Alawest Inc is a timber interest based in Northport, AL

Allegheny Country Farms – Monroe County

Allegheny Country Farms, Inc.

Sinks Grove, WV

Allegheny Wood Products – Preston and Tucker Counties

Founded in 1973 this family-owned hardwood sawmill company has long term wood supply agreements on approximately 400,000 acres of private land in addition to the company's land ownership.

Alliance Resource General Partnership LLC – Ohio County

This mining company began in 1971 when MAPCO Inc., a Fortune 500 diversified energy company entered coal production. They currently operate eleven mining complexes in Pennsylvania, Maryland, West Virginia, Kentucky, Indiana and Illinois. They are focused on steam coal production, and claim to be the third largest coal producer in the eastern United States, selling 31.9 million tons of coal in 2011.

Alpha Natural Resources – Kanawha, Lincoln, McDowell, Nicholas, Preston, Raleigh, Wayne and Boone Counties

This coal company was formed in 2002 by management and affiliates of First Reserve Corporation, a private equity firm, and went public in 2005. By 2011, Alpha claims to have become the third largest coal company and the fifth largest coal producer in the world. Alpha claims to be able to produce 126 million tons of steam and metallurgical coal from approximately 150 active coal mines and 40 coal preparation plants located throughout Virginia, West Virginia, Kentucky, Pennsylvania and Wyoming. They are also active in the purchase and resale of coal mined by other companies. They are headquartered in Bristol, VA.

ALYESKA INC – Preston County

ALYESKA, Inc. runs a privately owned campground facility,

named Big Bear Lake, that was opened in 1972.

American Disposal Services of West Virginia Inc. – Ohio County

American Disposal Services of West Virginia Inc. is a sanitary landfill company based in Wheeling, WV.

American Electric Power – Cabell, Marshall, Mason and Putnam Counties

Originally formed in 1906 in Albany, NY, this company is one of the largest electric utilities in the United States, serving over 5 million customers in 11 states over 200,000 square miles. They maintain and operate approximately 40,000 miles of transmission line, and 221,000 miles of distribution lines. They report \$54.4 billion in assets, an \$14.9 billion in revenues for 2012. They are headquartered in Columbus, OH.

American Resources Inc – Calhoun County

Missing data

Amherst Coal – Putnam County

Amherst Coal Company was purchased by Diamond Shamrock Corporation in 1981.¹ This company became Ultramar Diamong Shamrock Corporation in 1996, which is now owned by Valero Energy Corporation. Valero Energy Corporation is headquartered in San Antonio, TX.²

¹<http://www.nytimes.com/1981/05/21/business/amherst-coal-takeover-near.html>

²<http://investing.businessweek.com/research/stocks/private/snapshot.asp?privcapId=371545>

Arch – Barbour, Grant, Logan, Taylor, Tyler, and Upshur Counties

Arch Coal was formed in July 1997 through the merger of Ashland Coal, Inc. and Arch Mineral Corporation, a private partnership formed in 1969. In 1998 Arch Coal expanded their operations into the western United States, and this expansion continued through the last decade to include western coal operations in Montana, Wyoming, Utah and Colorado. They report sales of 141 million tons of coal to customers in 25 countries in 2012 and have coal mines in Illinois, Kentucky, Virginia, West Virginia, Wyoming, Colorado and Maryland. They are headquartered in St. Louis, MO.

Argus Energy, LLC – Wayne Counties

Lovely, KY

Arrow WV Inc – Fayette County

This is a nonprofit corporation formed in Texas in 2011, with ties to the National Boy Scouts of America Foundation and the Boy Scouts of America, both located in Texas. They are headquartered in Irving, TX.

Associated Universities Inc. – Pocahontas County

This corporation works in partnership with universities and the federal government to design, develop, manage and operate large-scale research facilities. They operate the National Radio Astronomy Observatory's Robert C. Byrd Green Bank Telescope in Green Bank, West Virginia.

Bane R Z Inc – Jefferson County

Summit Point, WV

Bayer Material Science – Marshall County

This corporation was established in 2004 following a comprehensive restructuring of parent company Bayer AG. Bayer AG has researched, developed and produced rubbers and plastics for over a century. Bayer Material Science has approximately 30 major production sites around the world, and various smaller plants around the world. Bayer Material Science and Bayer AG are headquartered in Pittsburgh, PA.

Bear's Heil Inc – Hardy County

This corporation runs a private hunting ground in Moorefield, WV.

Beaver Coal Company – Raleigh County

This corporation owns approximately 50,000 acres of surface and mineral property located in Raleigh County, all within a 10 mile radius of Beckley. Much of Beaver Coal Company properties are under mineral and or mineral and surface leasing agreements. The company also develops commercial and residential properties, with approximately 700 families and 90 businesses leasing property from Beaver Coal Company in 2005. They are headquartered in Beckley, WV.

Beckwith Lumber – Barbour, Braxton, Lewis, Pocahontas, Randolph and Webster County

Slatyfork, WV

Bee Creek Hunting Club – Calhoun County

This private hunting club was founded in 1968.

Bens Run Land Company Limited Partnership – Pleasants and Tyler Counties

Columbus, OH

Berkeley Springs Develop – Morgan County

Rockville, MD

Berkeley Springs Water Co – Morgan County

Berkeley Springs, WV

Berwind Corp/Land – Boone and McDowell County

Berwind Corporation, the parent company, began in 1886 as the Berwind-White Coal Mining Company. Berwind Natural Resources Corporation is a land and resource management company with properties in Pennsylvania, Kentucky, Virginia and West Virginia. This corporation reports owning approximately 400 million tons of coal reserves and over 25 billion cubic feet of natural gas reserves. They both lease and develop their own mineral resources, although coal leasing is Berwind Natural Resources Corporation's major business. They are headquartered in Philadelphia, PA.

Bethany College – Brooke County

This Christian liberal arts college was founded in 1840.

Black Brian D Co Inc. – Tucker County

Akron, OJ

Black Land – Lewis County

Website is down

Blackburn Plantation Farms – Mineral County

Keyser, WV

Blackrock Enterprises LLC – Barbour County

Salem, WV

Blue Eagle Land LLC – Clay and Kanawha Counties

Bristol, VA 24202

Blue James T & Sons Inc – Jefferson County

Missing data in the WV SOS database. Manta.com shows a James T. Blue & Sons, Inc. in Shenandoah, WV.

Bragunier Farms – Pendleton County

Missing data in the WV SOS database

Branch Mountain Hunting Club Inc – Hardy County

Moorefield, WV

BSA Buckskin Council – Pocahontas County

The Buckskin Council of the Boy Scouts of America was formed in 1919 and works in 19 counties in West Virginia, three counties in Virginia and one county in Kentucky.
